I have been working with my project exam 1 resit and I am pretty happy with the site. When I got the task of what I should be doing I started by making a Adobe Xd prototype and designing how I wanted the site to look. After making the prototype I started coding and the html went very well and also the css went well. The site looks just how I designed it in adobe xd and I am happy with how it looks.

First I finished all the html so it would fit all the functions and objects that I wanted to have on the site. After all that was done I started to style it with css so it would look like I had made it on adobe xd. Both the html and css came out very well and it all worked as it should, so I started with all the javaScript after that.

With the java script the contact validation went very well and it works perfectly. But when it comes to when the user should type in ingredients to the search bar on the recipes page I got some trouble. When text is typed in the name, description, image of the dish and how many servings it gives is shown. Because I used the includes() method when searching if a recipe includes that letter in one of the four fields above it will get shown. And that works very well, but if I press the delete key to remove the letters that I type in the html or the recipes do not disappear but it does something wrong, and it does not work to write in any letters again so To make it work again I have to refresh the page and then it works.

That is the only problem with the site and what I really struggled with. But otherwise I felt it was good.
